

Yindjibarndi Aboriginal Corporation and renewable energy company ACEN have agreed to work together to build renewable energy projects on Yindjibarndi *Ngurra*.

Yindjibarndi and ACEN have formed a new company to do this called Yindjibarndi Energy Corporation (YEC). ACEN has the same values as Yindjibarndi and has developed big wind and solar projects before.

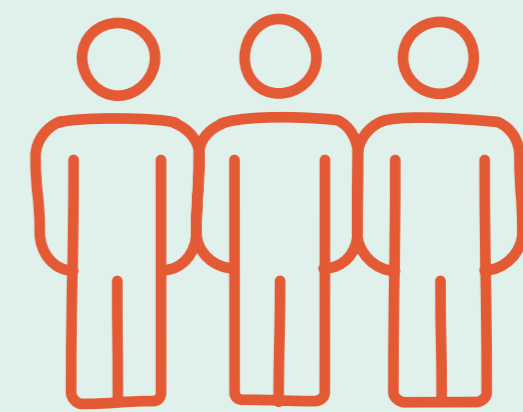

YEC enables Yindjibarndi people to control their own destiny and the development on their *Ngurra* rather than other developers seeking to develop projects with limited involvement of the Yindjibarndi people.

Renewable energy projects will only be developed in areas Yindjibarndi people approve of, and protects Aboriginal cultural heritage.

Yindjibarndi Aboriginal Corporation will own part of YEC.

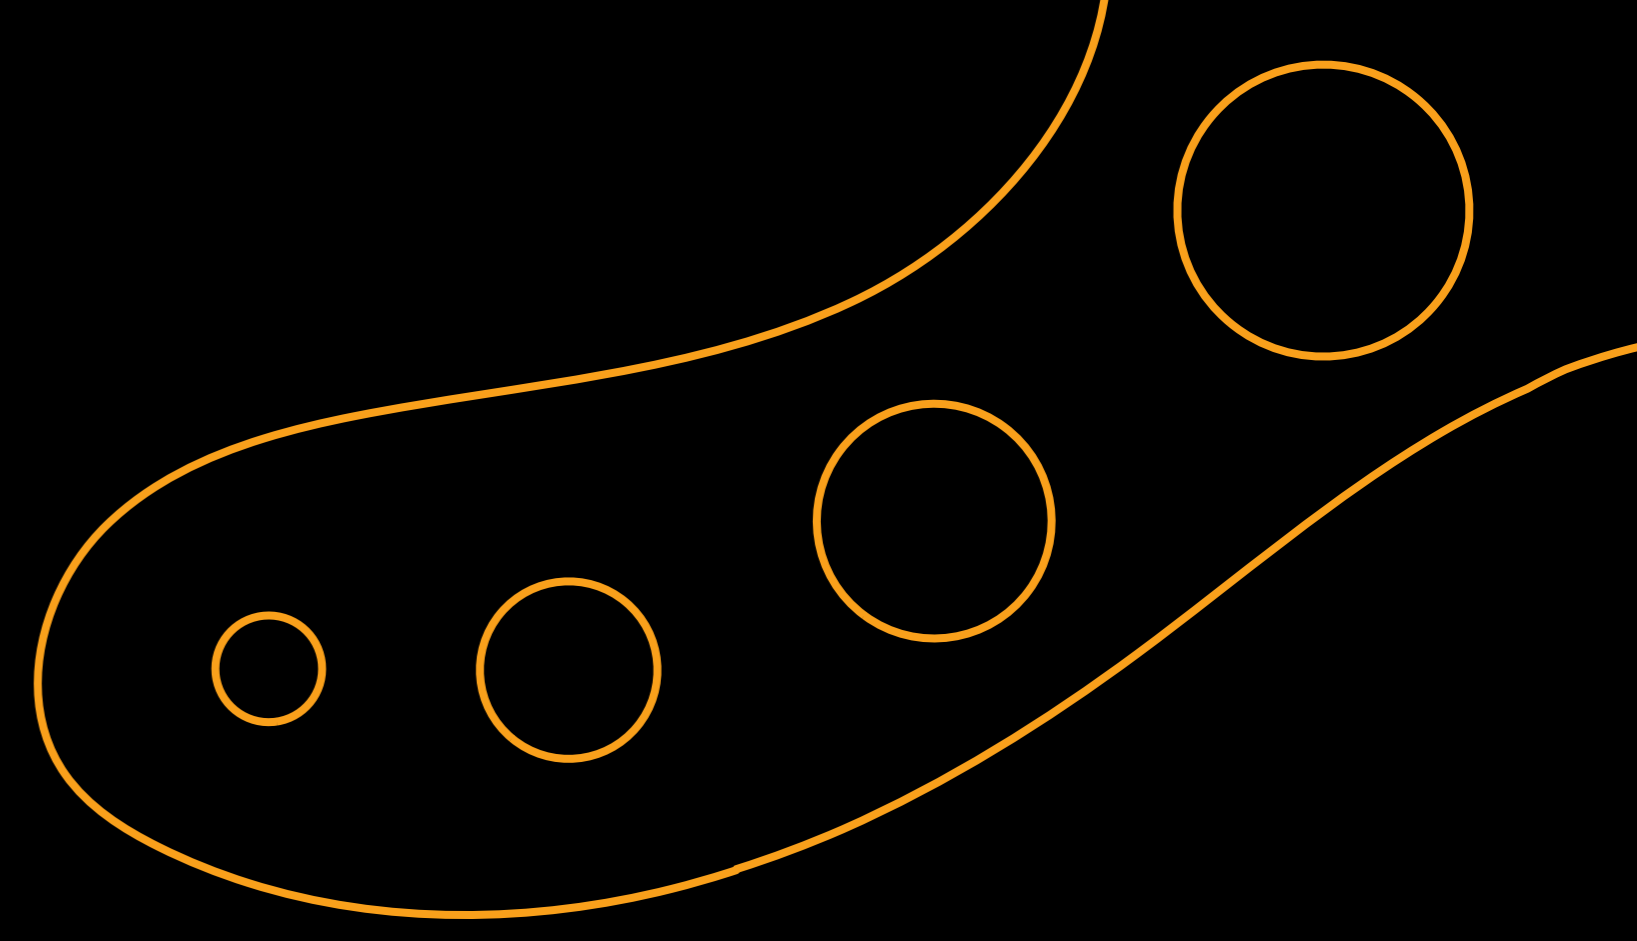

Jobs and training opportunities for Yindjibarndi people to return to their homelands will be provided.

 Yindjibarndi Energy Corporation

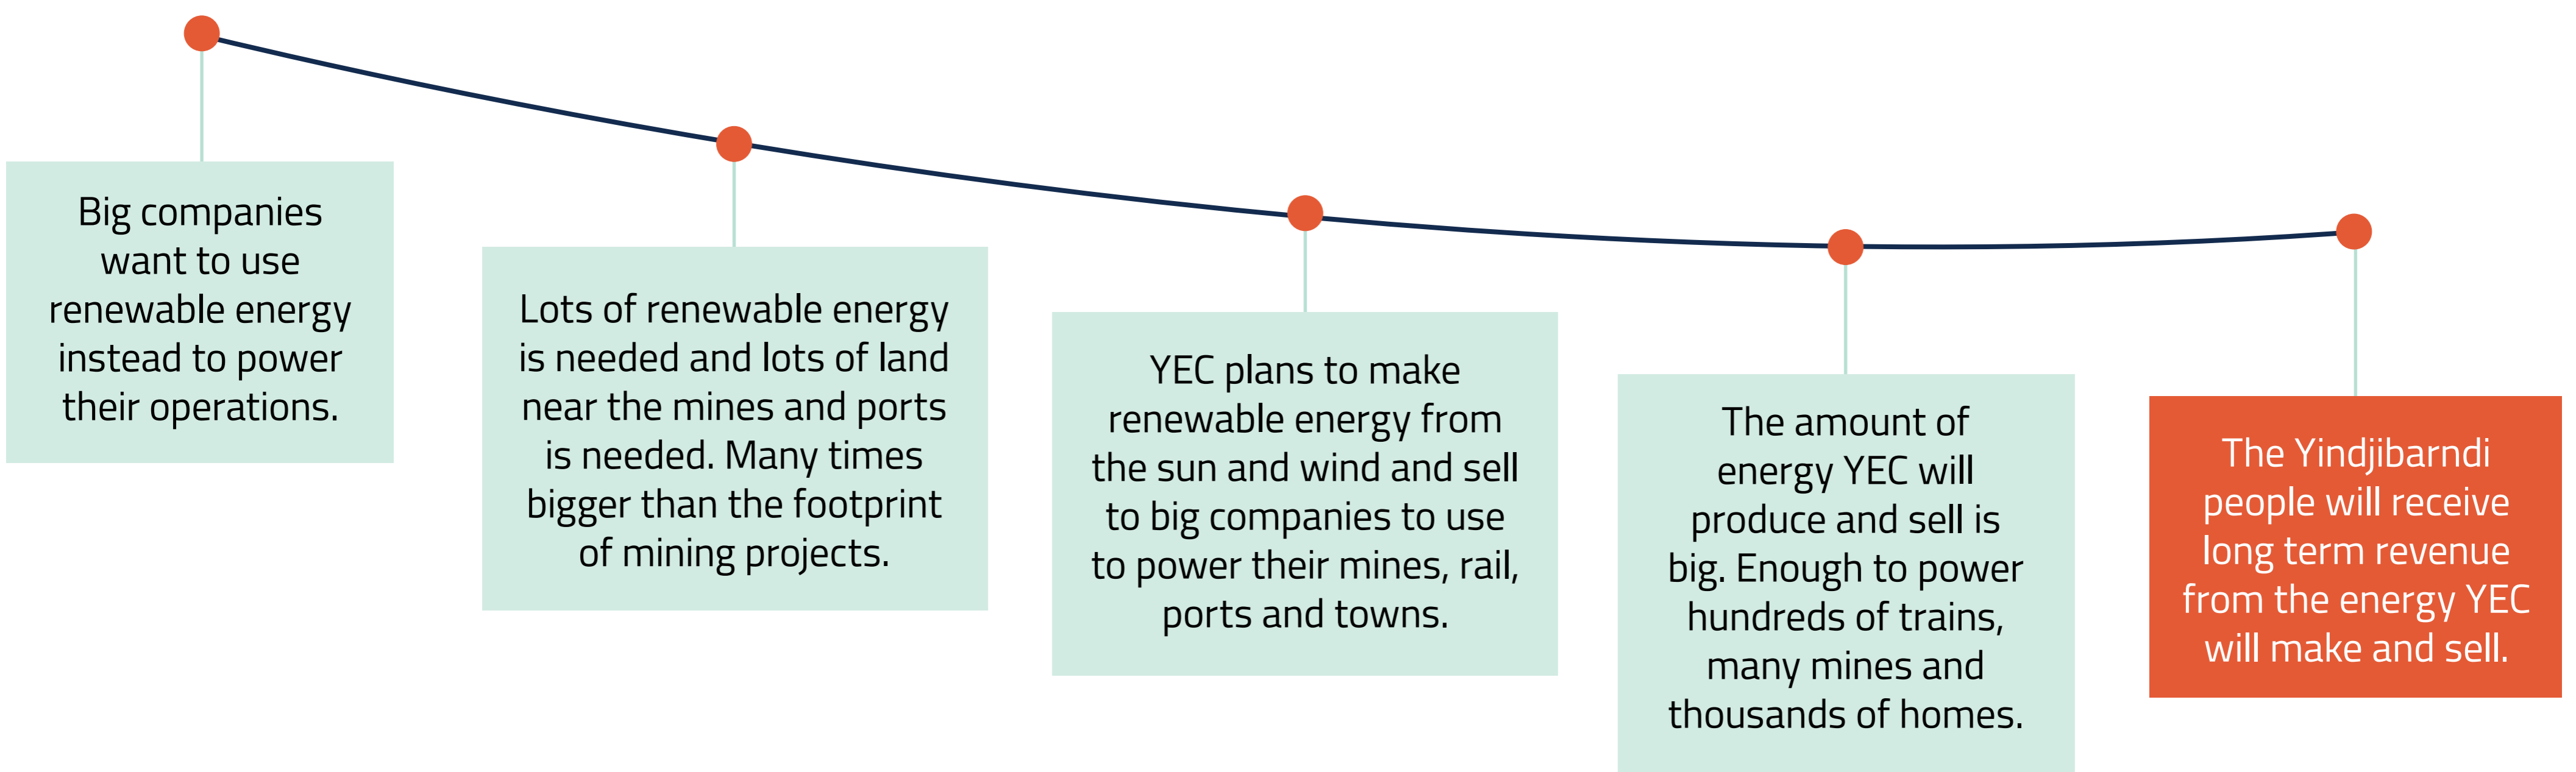

What YEC plans to do

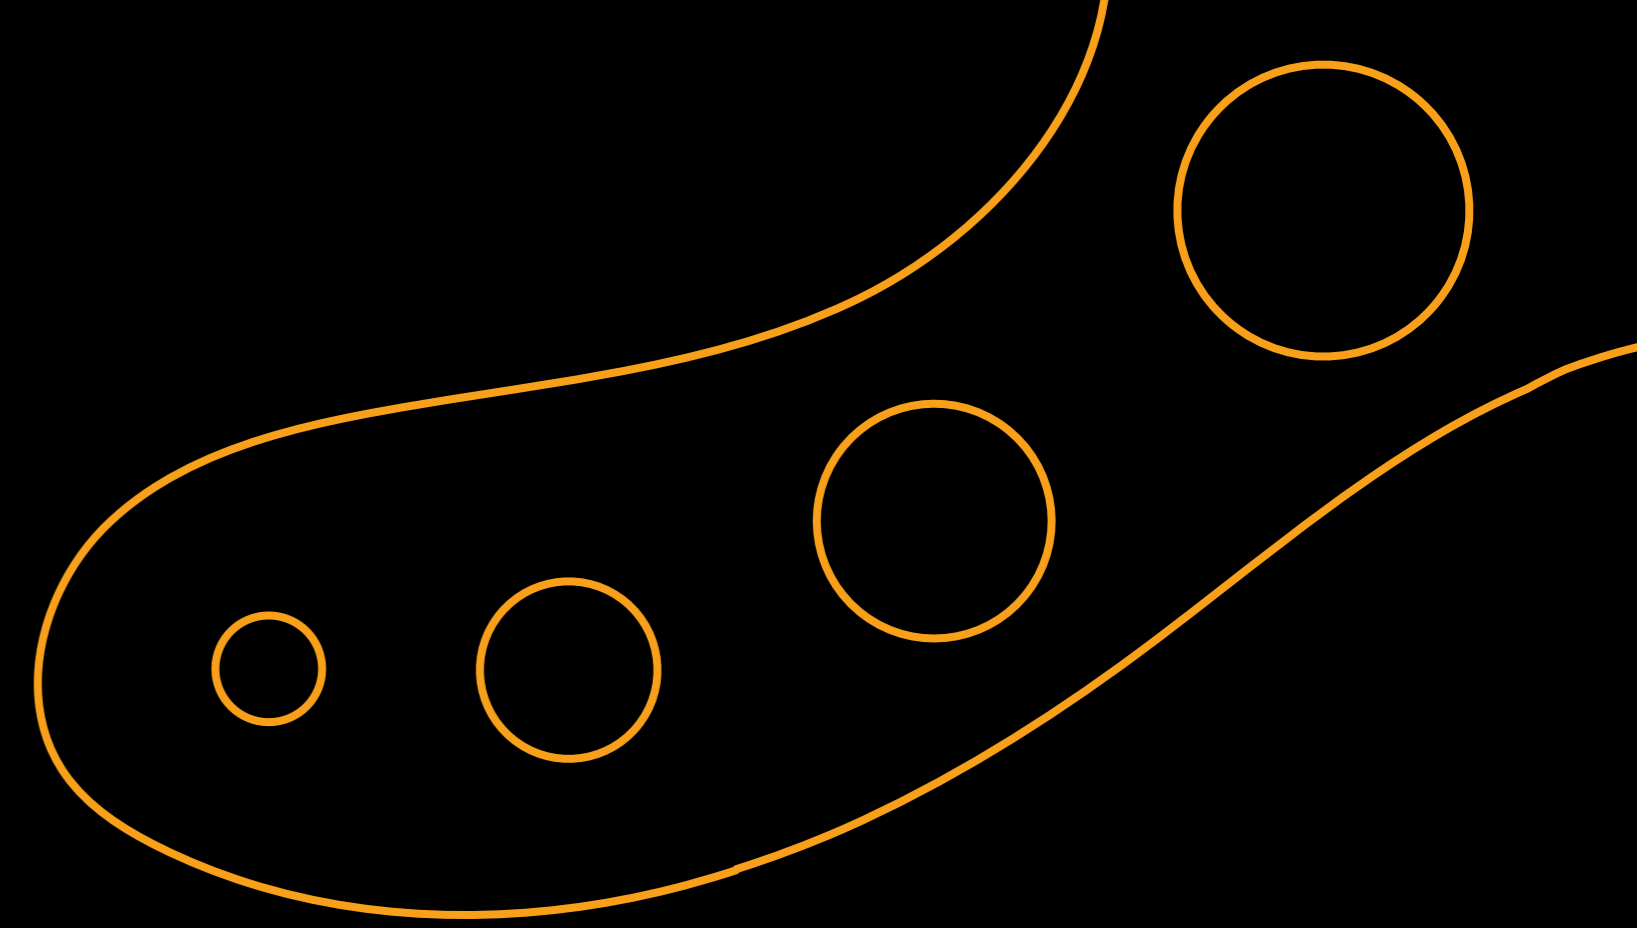

Mining and oil and gas companies in the Pilbara need to significantly reduce or stop using diesel and gas generators and power stations to power the mines, rail, ports and towns soon.

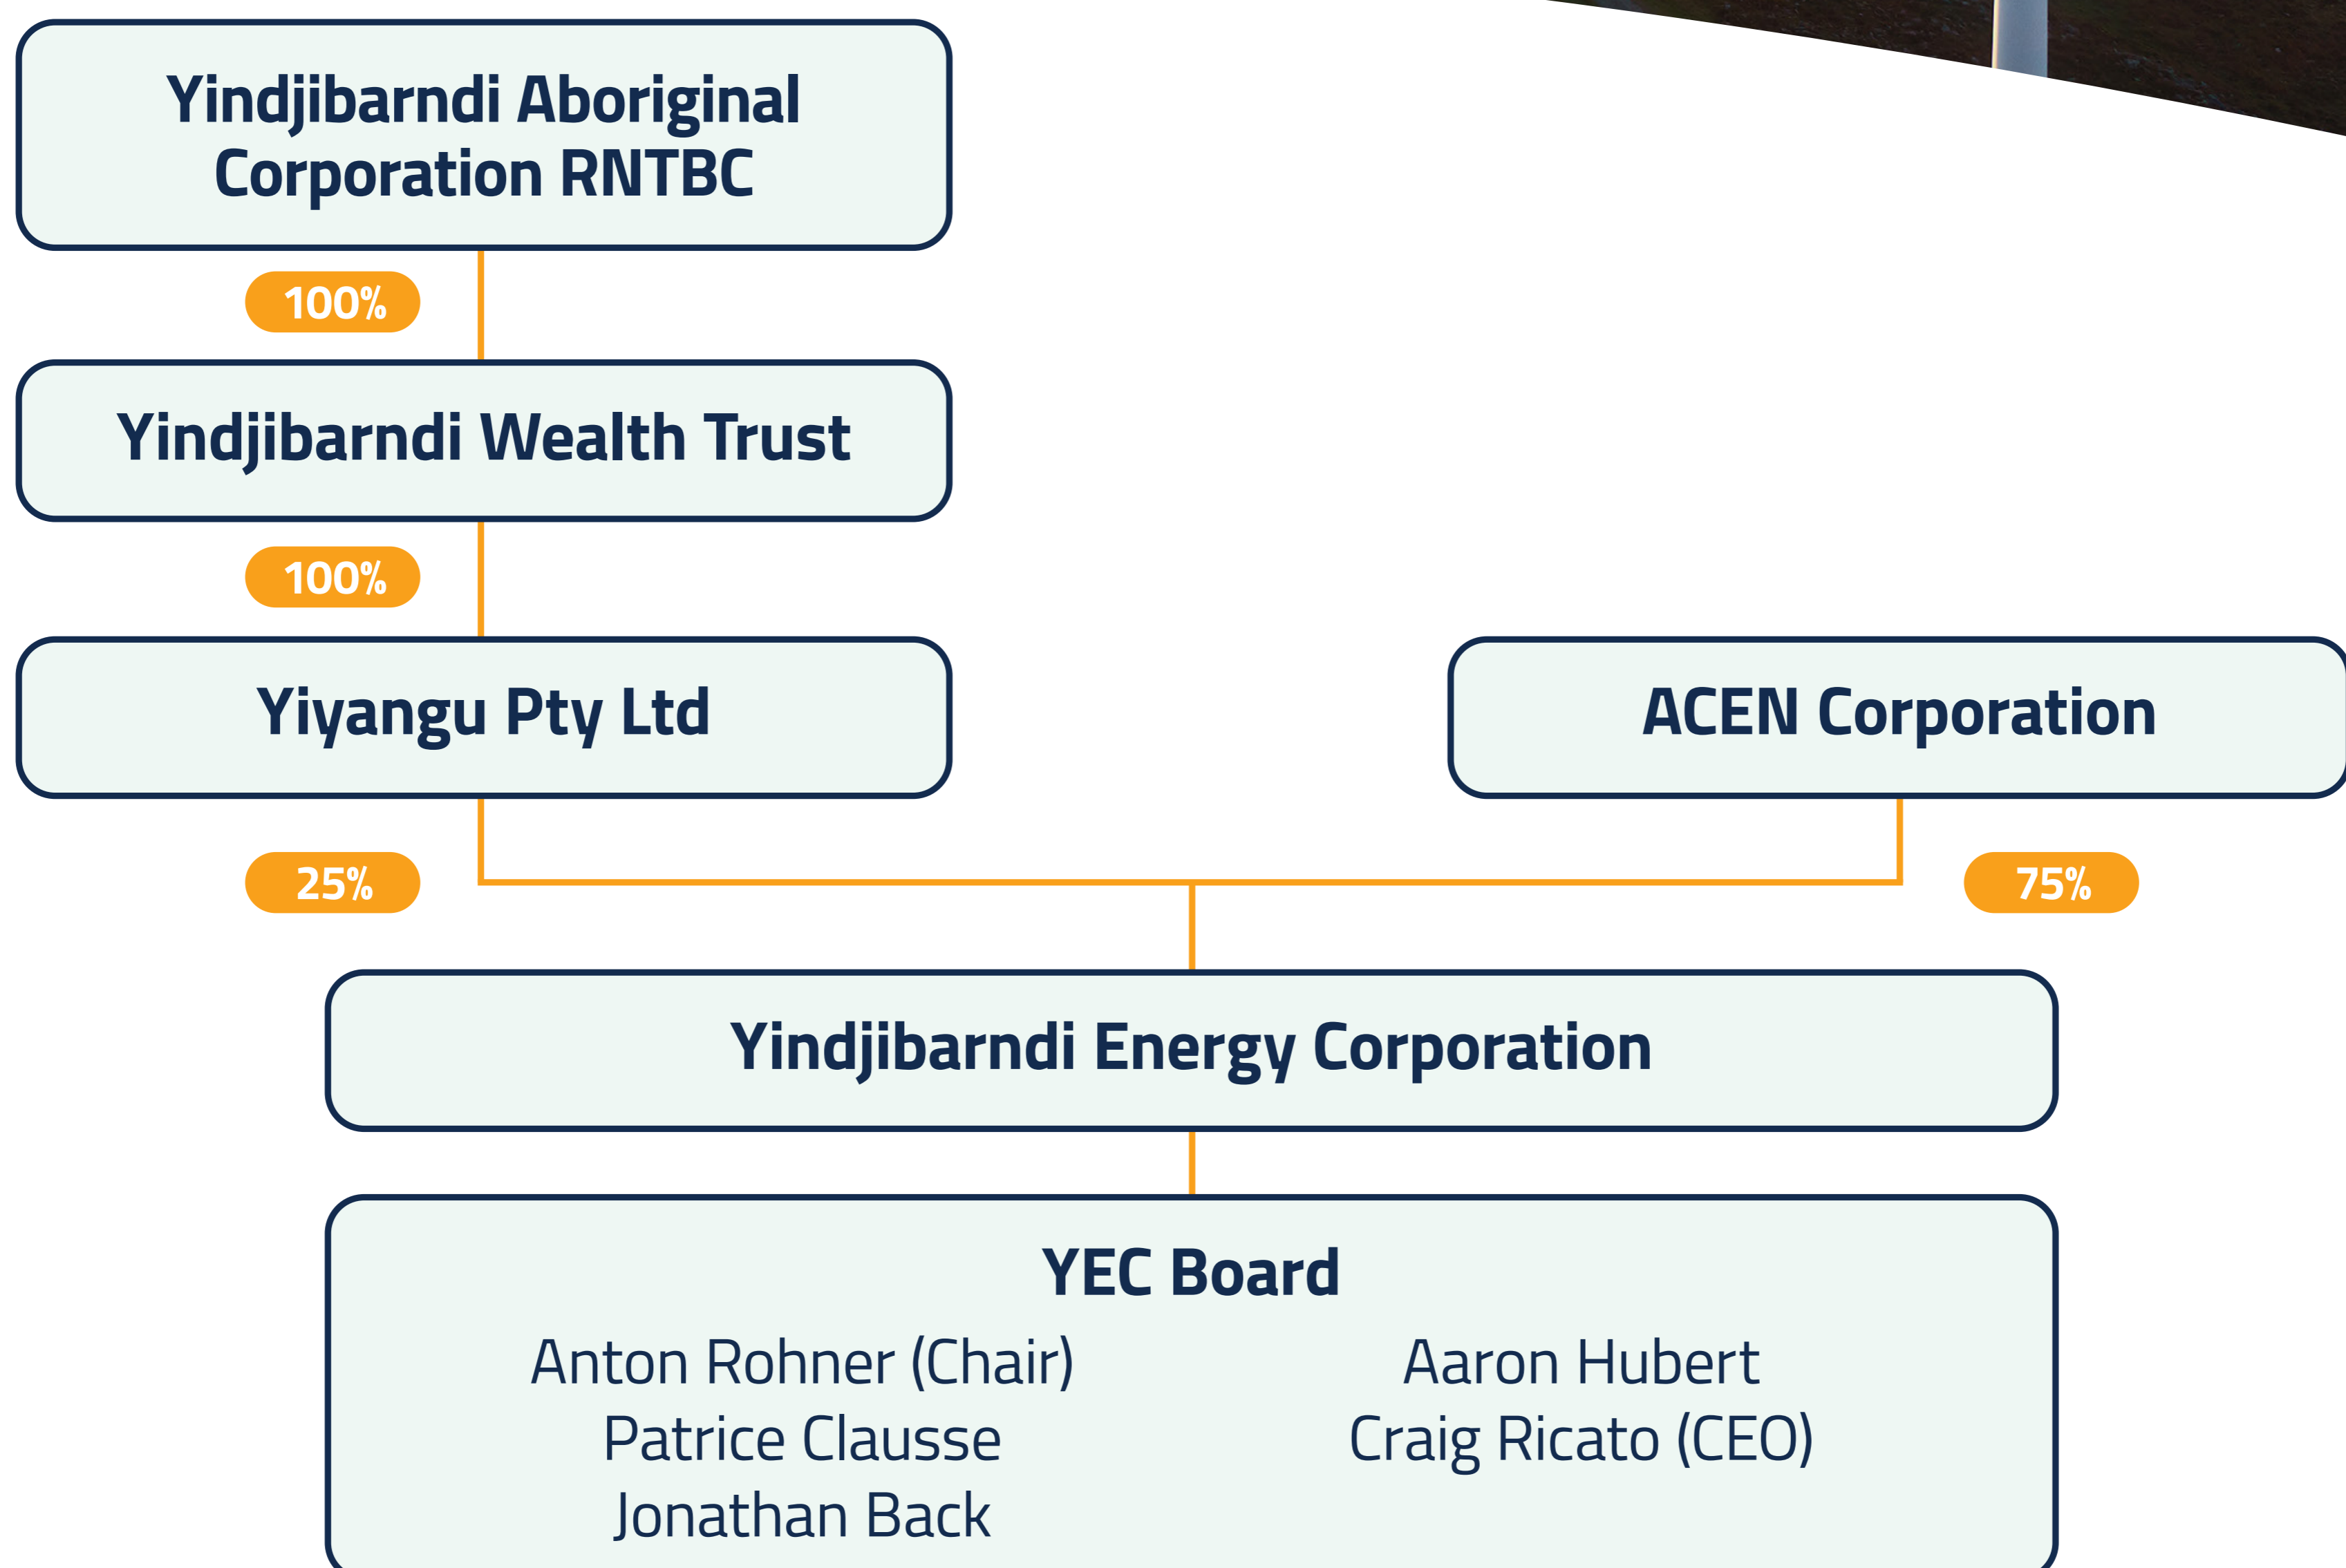

Renewable energy is also called 'clean energy' or 'green power' because it doesn't pollute the air or the water. Renewable energy from the sun and the wind can be used to make this power.

FOR MORE INFORMATION:

The Yindjibarndi people will receive long term revenue from the energy YEC will make and sell

About wind and solar energy

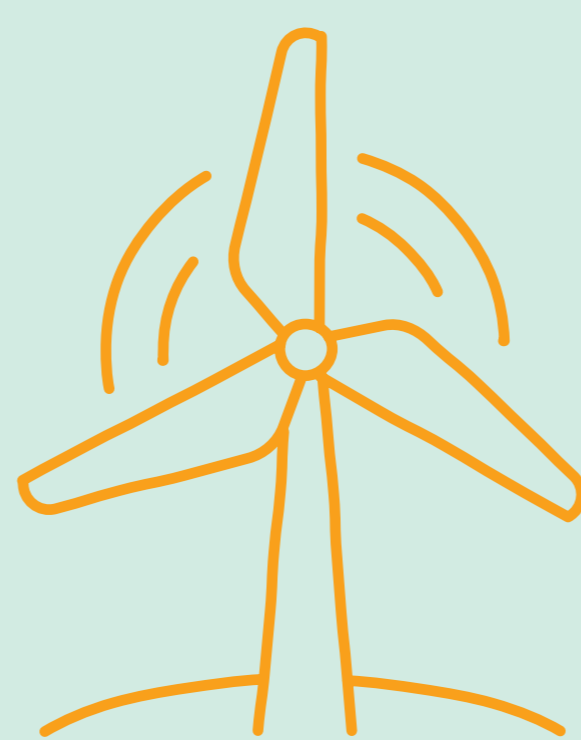

Solar energy

Solar energy is made by the heat and light of the sun. Power is made when energy from the sun is turned into electricity.

Solar panels last around **25** years.

About **8%** of a solar panel is recyclable in Australia.

CEC, October 2020

Wind energy

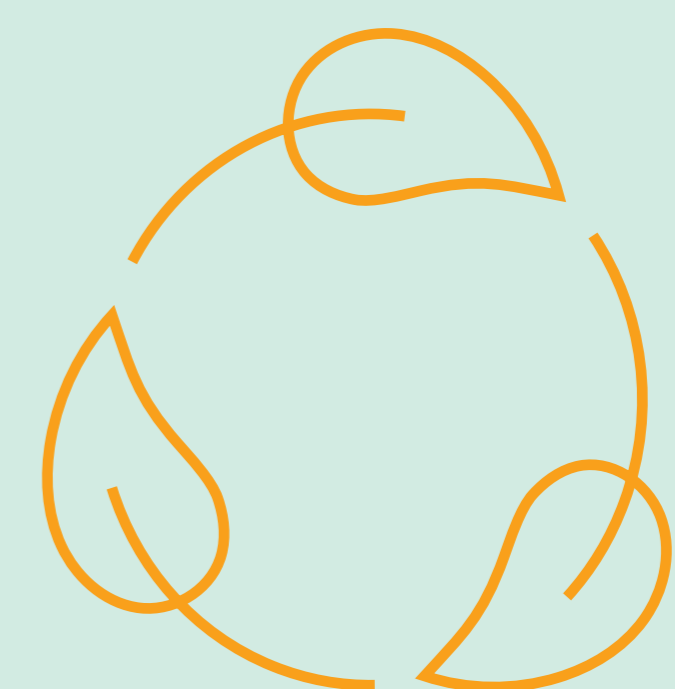

Wind energy is made when the wind turns huge turbines

Wind energy is made when the wind spins large blades around. This spins a generator which makes electricity.

Wind turbines last around **30** years.

About **90%** of a wind turbine is recyclable in Australia.

CEC, May 2023

Recycling

Solar panels and wind turbines can be taken down and removed, and their parts recycled at the end of their operational lives.
